

Cloud Automation

Who am I ?

Tabalwor®

MODSOFT

Provides Cloud Services Management and engineering consultations.

Cloud Automation

And some python

Why do we need this ?

Why not just use
ssh & ftp ?

Hello, We have noticed that one or more of your instances are running on a host degraded due to hardware failure. i-666XXXXX

The host needs to undergo maintenance and will be taken down at 12:00 GMT on 2011-05-13. Your instances will be terminated at this point. The risk of your instances failing is increased at this point. We cannot determine the health of any applications running on the instances. We recommend that you launch replacement instances and start migrating to them.

Feel free to terminate the instances with the `ec2-terminate-instance` API when you are done with them.

Sincerely,

The Amazon EC2 Team

Infrastructure as Code

“We should be able to build our infrastructure
without **manual** ssh.”

“Deployments should be hands-free.”

Completely

“Server instances should not live for a long time.”

Where to store data ?

- Block storage services like AWS's EBS and DO's Block storage.
- Object storage services like S3.
- Redundant databases.

Infrastructure as Code

Python ?

Python

For “Javascript” Devs

Installing Python

- For Unix Based Systems
- For Windows Systems

Python 2 vs Python 3

Basic Hello World

```
console.log("Hello, Geeks");
```

First Python Code

```
print "Hello, Geeks"
```

Variables

```
var x = 1; // Integer
```

```
var y = "String"; //String
```

```
var z = true; //Boolean
```

Variables

`x = 1 // Integer`

`y = "String" // String`

`z = True // Boolean`

Function

```
function sayHi(name){  
    console.log("Hi "+name);  
}
```

Function

```
def sayHi(name):  
    print "Hi "+name
```

Loops

```
for(var x = 0; x < 10; x++){  
    console.log(x);  
}
```

Loops

```
for x in range(10):
```

```
    print x
```

Loops

```
var numbers = ["One", "Two", "Three"];  
  
for(var x = 0; x < numbers.length, x++){  
    console.log(numbers[x]);  
  
}
```

Loops

```
numbers = ["One", "Two", "Three"]
```

```
for number in numbers :
```

```
    print number
```

If statements

```
var x = 10;  
  
if(x > 10){  
    console.log("more than 10");  
}  
else if (x < 10){  
    console.log("less than 10");  
}  
else{  
    console.log("Equals to 10");  
}
```

If statements

```
x = 10
```

```
if x > 10:
```

```
    print "more than 10"
```

```
elif x < 10:
```

```
    print "less than 10"
```

```
else:
```

```
    print "Equals to 10"
```

The screenshot shows the 'Finalize and create' step of the DigitalOcean Droplet creation process. The page has a white background with a blue header bar containing the DigitalOcean logo and navigation links: Droplets, Images, Networking, API, and Support. Below the header, there's a section for 'Add your SSH keys' with a 'mac-work' key selected and a 'New SSH key' button. The main section is titled 'Finalize and create' and contains two side-by-side panels. The left panel, 'How many Droplets?', shows '5 Droplets' with minus and plus buttons. The right panel, 'Choose a hostname', shows a list of hostnames: 'ubuntu-focal-3.01' through 'ubuntu-focal-3.05'. A large green 'Create' button is at the bottom right.

Why DigitalOcean ?

- Simple products.
- Simple pricing.
- **Good api.**

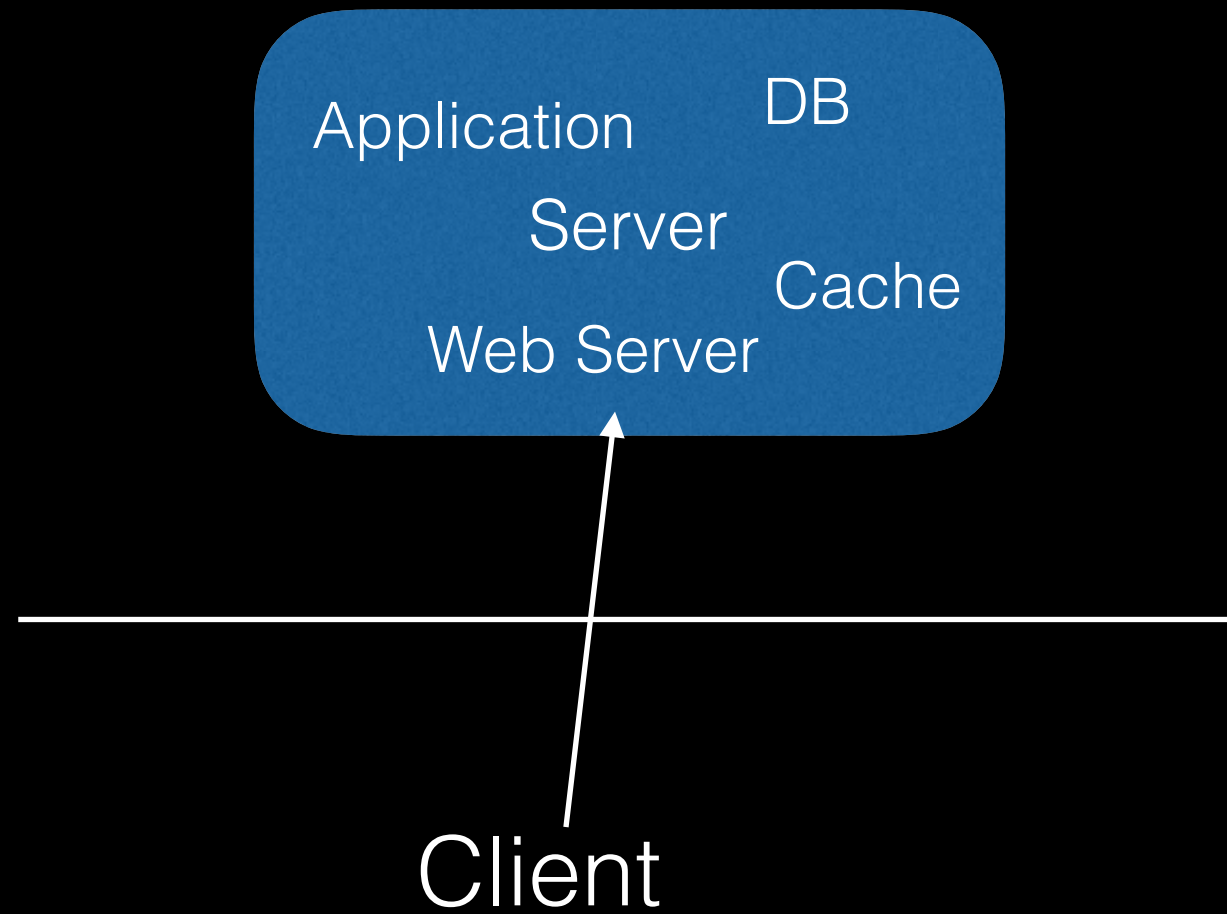

Deployments

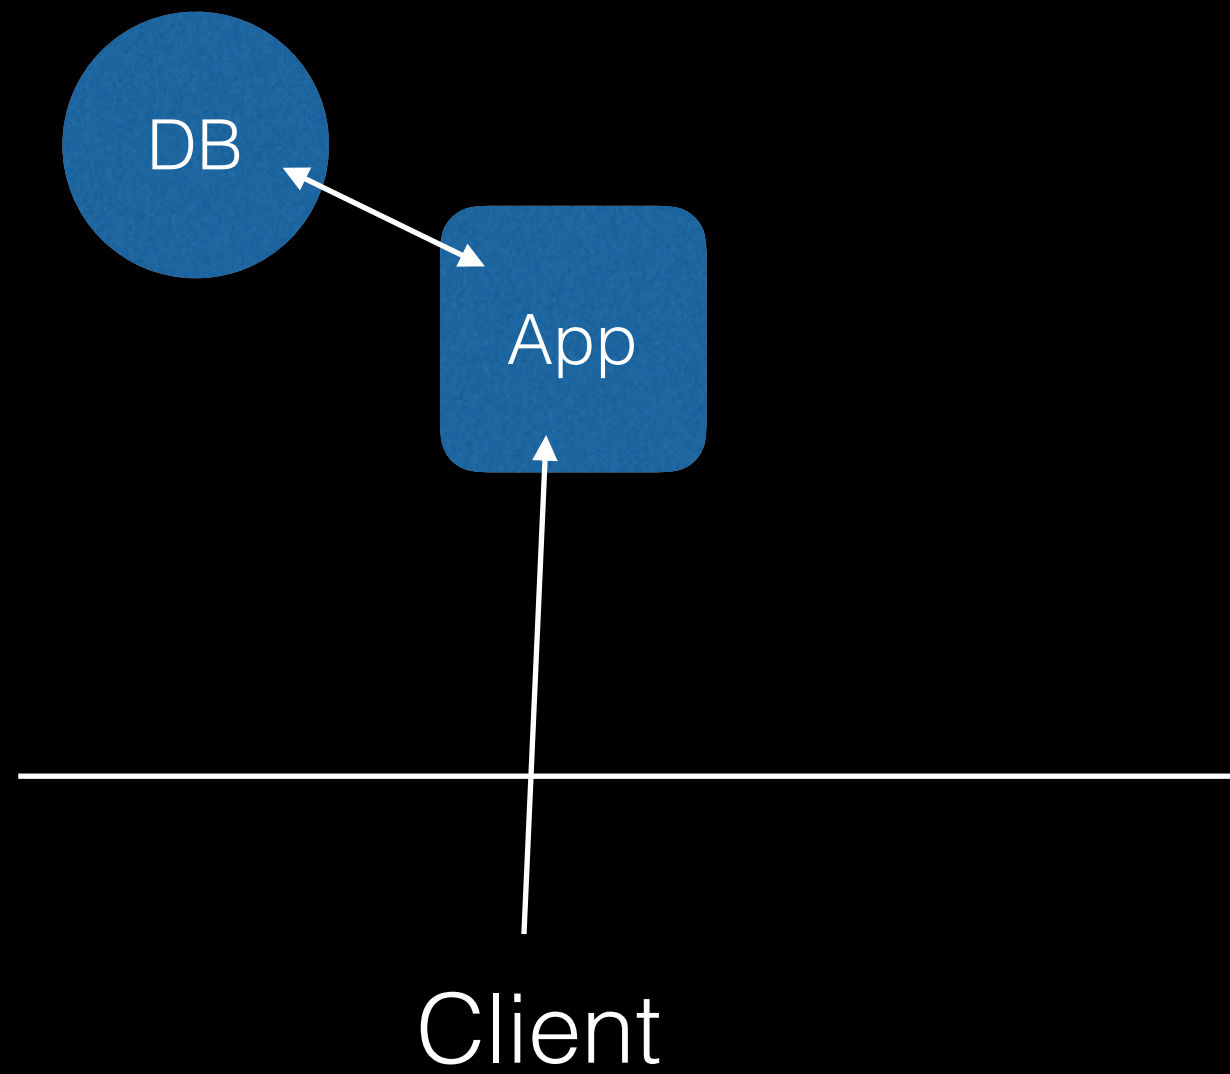

- One Server in-place deployments.
- Multi-server in-place deployments.
- Multi-server reversible deployments.
- Multi-server Blue/Green deployments.

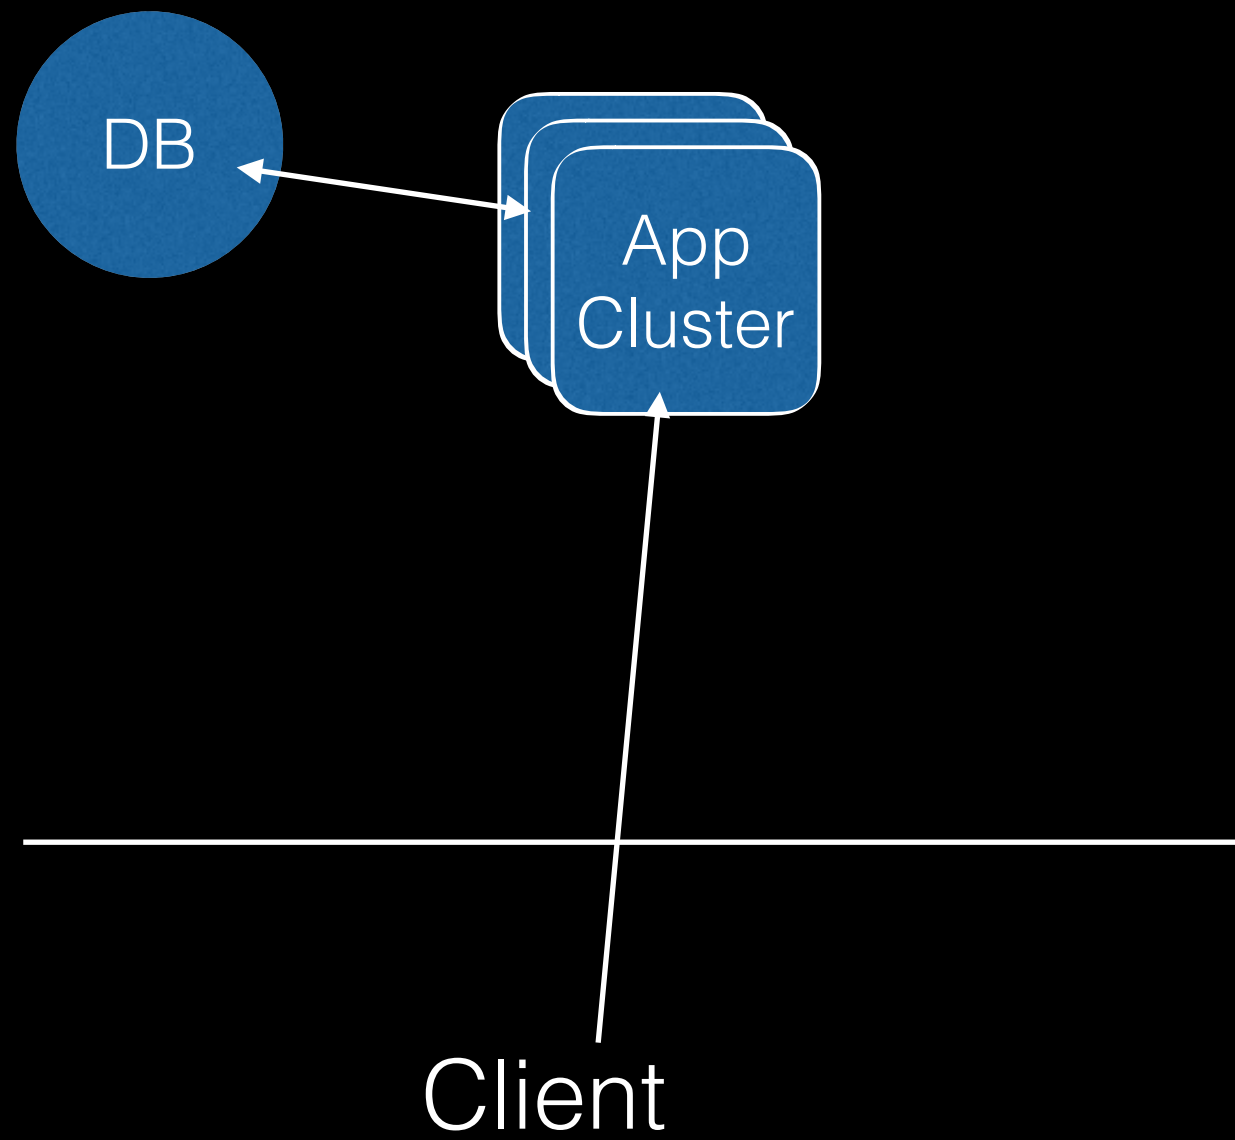

One Server Deployments

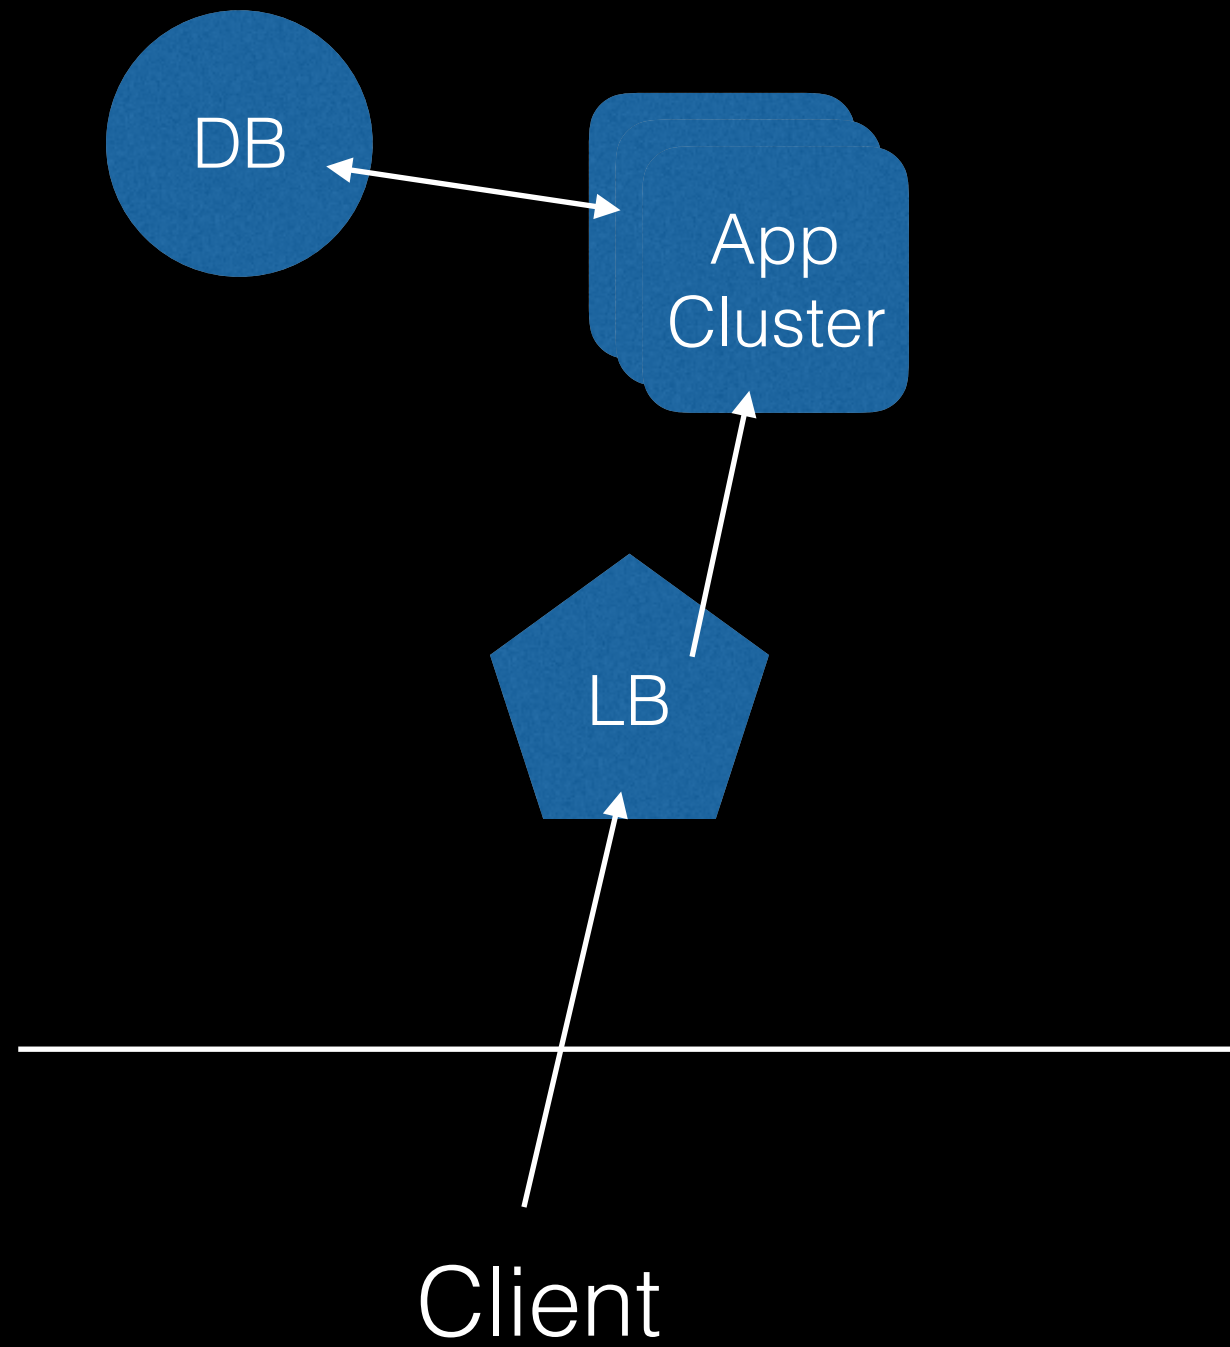

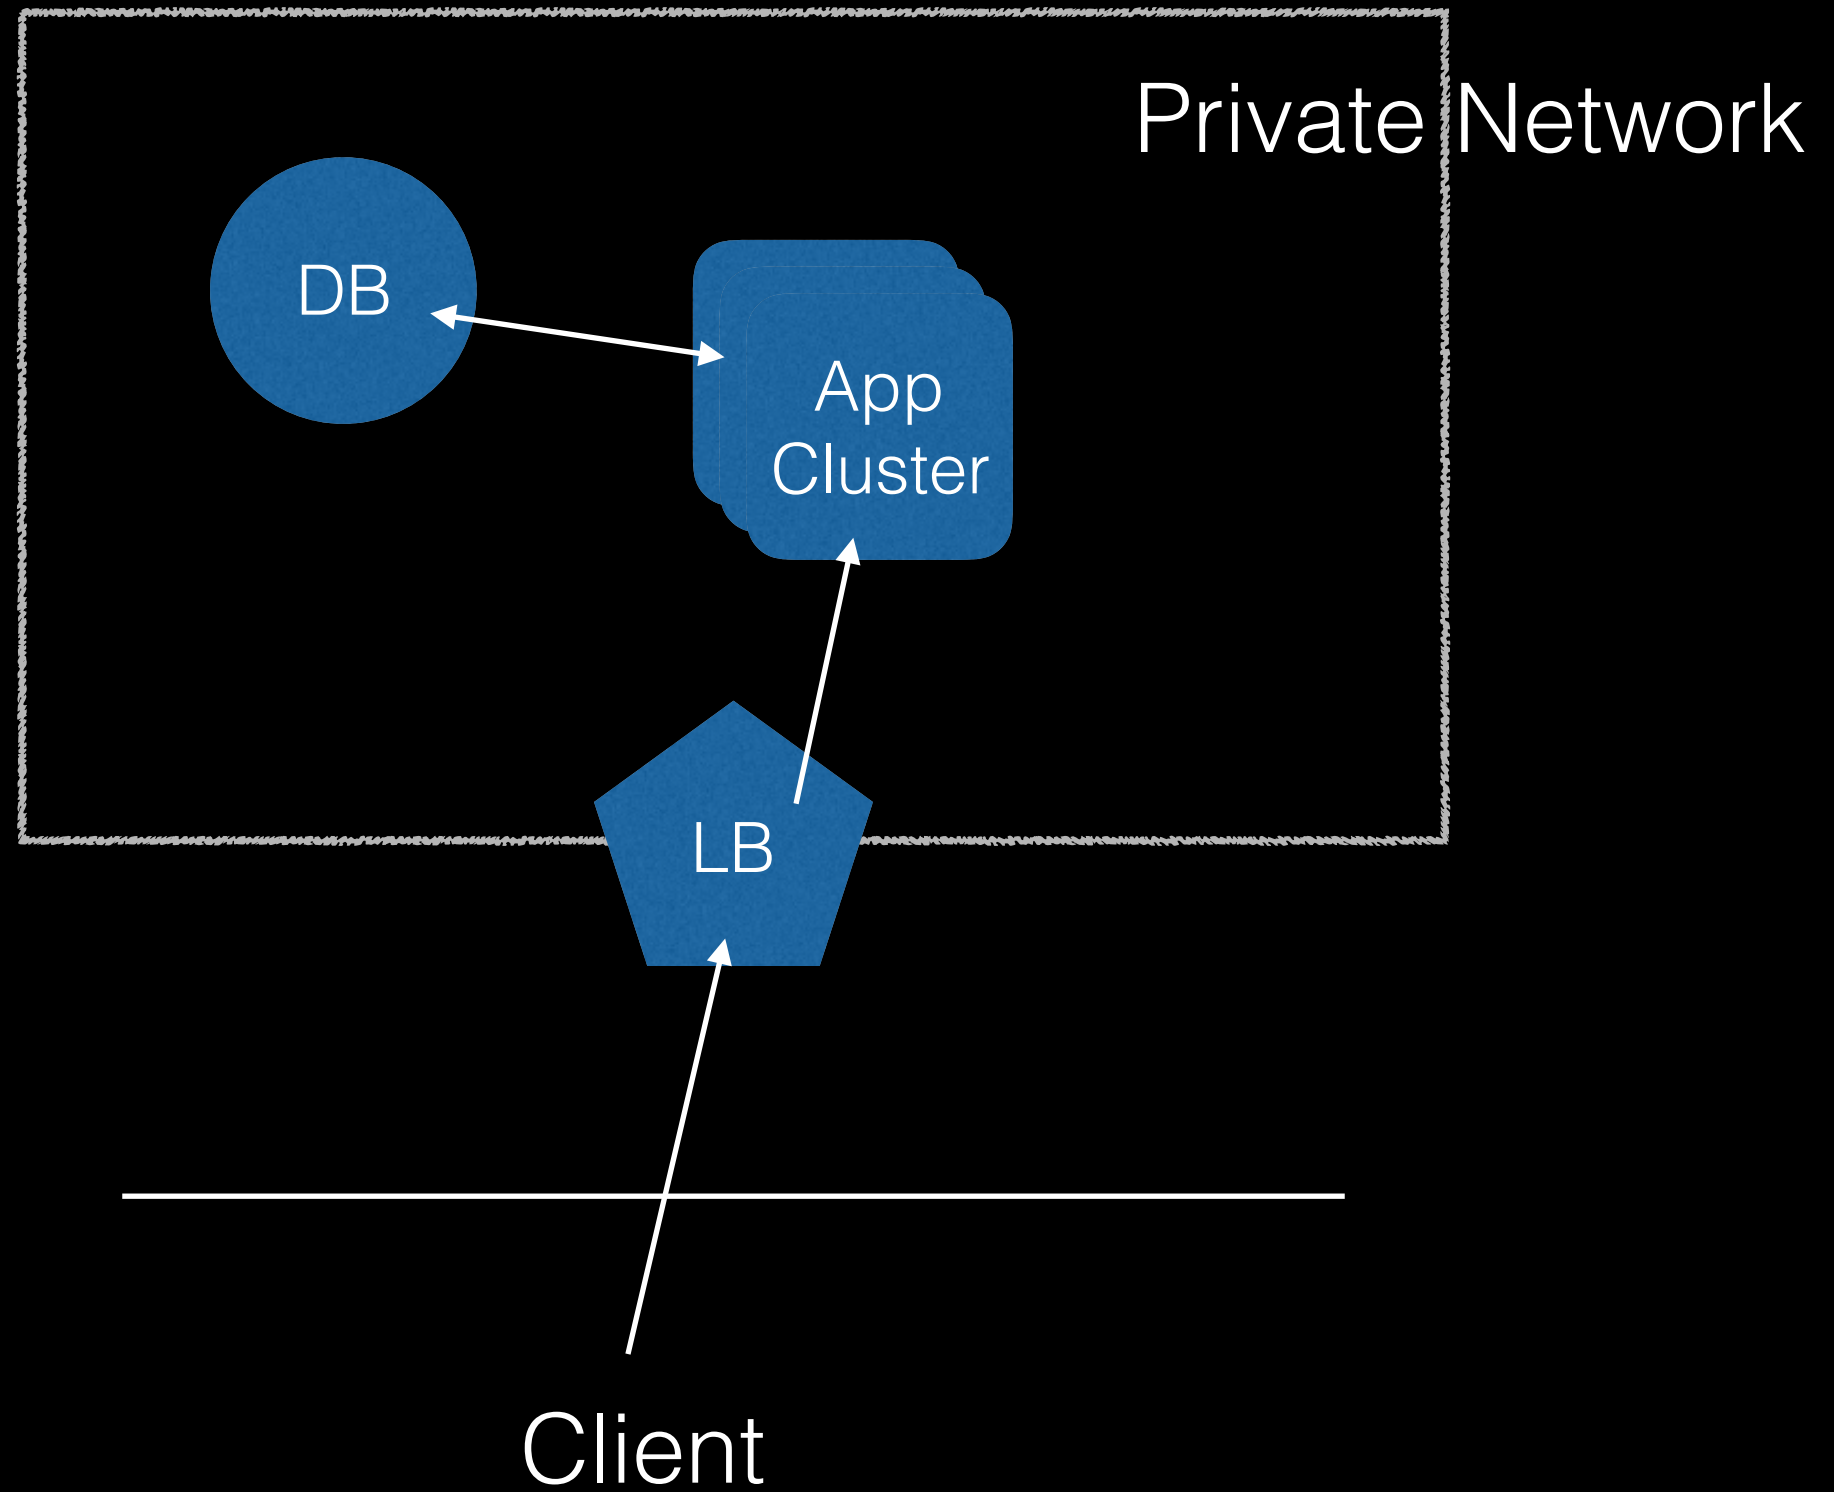

Multi Server Deployments

Load Balancer

Making our deployment
Reversible

Initial deployment

1. Clone repo in new directory
2. Create an symlink for that directory named “current”
3. Point web server to the symlink

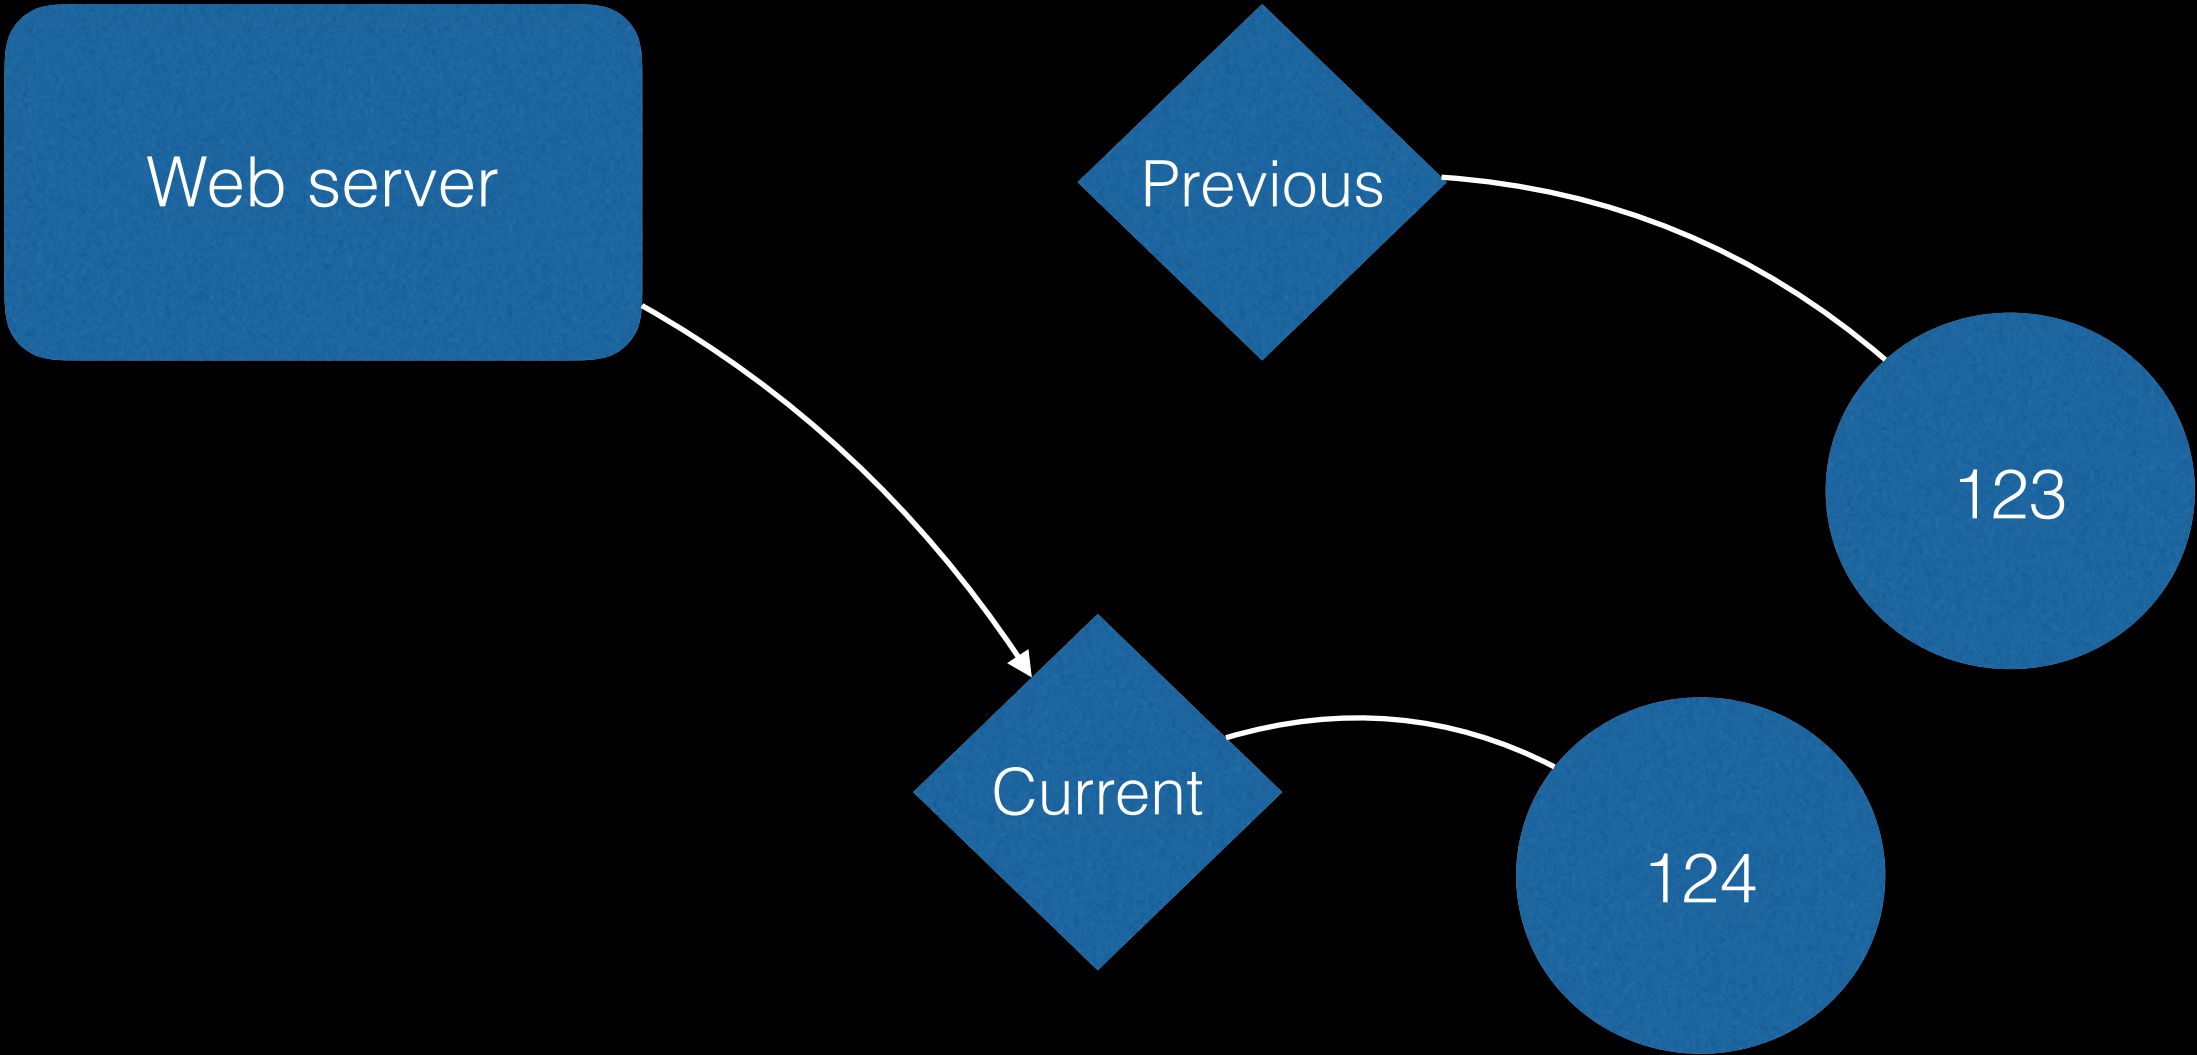

new deployment

1. Clone repo in new directory.
2. Renamed the “current” symlink to “previous”.
3. Create an symlink for the new directory named “current”.
4. Reload web server.

Thanks :)
